

A more efficient lumber drying system

Higher Efficiency, Higher Profit

Don't mistake speed for more profit.

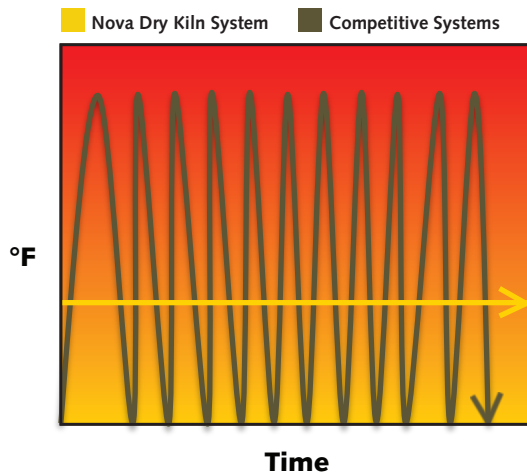

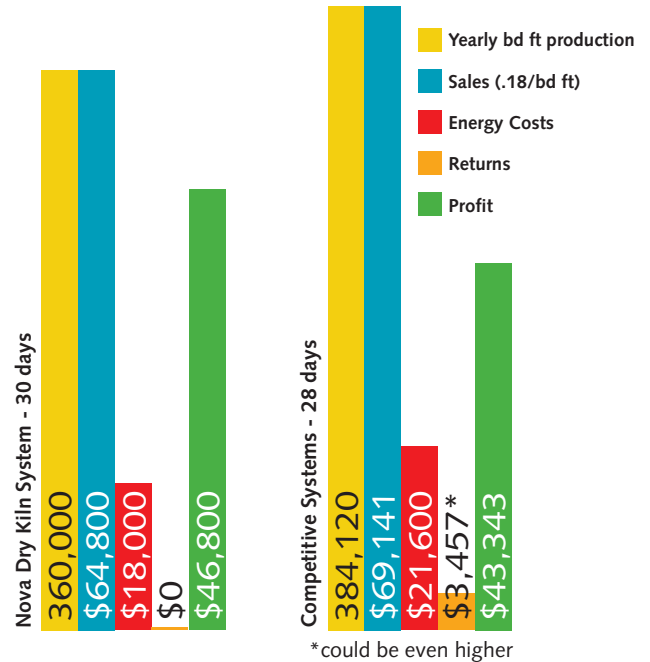

Nova Dry Kilns have a lower operating cost. When your system is running 24 hours a day, higher efficiency means more dollars for your bottom line.

This graph shows real profit over a one year period on 4/4 Red Oak dried from green to 6% moisture content.

Competitive systems cost 20% higher to operate per board foot and will contain product rejects.

In one year, that is **8% more profit.**

Why take the risk?

with higher quality output

A gentler process

Competitive systems have wide temperature swings which stress the wood and cause degrade during the drying process. Nova Dry Kiln systems have a gentler approach that dries the wood at lower temperatures resulting in more **uniform drying and a brighter finish.**

Your reputation, your bottom line
